

Data Tables

Table	Type	Purpose
Sales	Fact Table	Stores order and sales transaction data
Products	Dimension Table	Contains product, category, brand, price and rating information
Customers	Dimension Table	Contains customer details and customer segmentation
Dim_Date	Dimension Table	Used for date and time-based analysis

Relationships

- Dim_Date[Date] → Sales[Order_Date]
- Dim_Date[Date] → Sales[Delivery_Date]
- Products[Product_id] → Sales[Product_id]
- Customers[Customer_id] → Sales[Customer_id]

Key Calculations / Measures

- Total Sales - SUM(Sales[Total_Amount])
- Total Orders - DISTINCTCOUNT(Sales[Order_ID])
- Total Quantity Sold - SUM(Sales[Quantity])
- Total Customers - DISTINCTCOUNT(Sales[Customer_ID])
- Average Order per Customer - DIVIDE([Total Orders], [Total Customers])

- Cancellation Rate - `DIVIDE([Cancelled Orders], [Total Orders])`
- Return - `DIVIDE([Returned Orders], [Total Orders])`
- Average Delivery Days - `AVERAGE(Sales[Delivery Days])`

Calculated Column

- Delivery Days

DAX: Delivery Days =

```
IF(
    ISBLANK(Sales[Delivery_Date]),
    BLANK(),
    DATEDIFF(
        Sales[Order_Date],
        Sales[Delivery_Date],
        DAY
    )
)
```

Note:

This model documentation describes the data model, relationships, calculated columns, DAX measures, filters, and their usage within the E-Commerce Sales & Customer Analytics Dashboard. The model is designed using a star-schema approach, with the Sales table serving as the central fact table and Products, Customers, and Dim_Date serving as supporting dimension tables. The model enables consistent, interactive, and efficient analysis across sales, products, customers, geography, and order & delivery performance.
